

# Compilers

## CS143

11:00-12:15TT  
B03 Gates

Prof. Aiken CS 143 Lecture 1

1

## Administrivia

- Everything is on the class Web site  
<http://www.stanford.edu/class/cs143/>
- Syllabus is on-line, of course
  - Assignment dates will not change
  - Midterm
    - Thursday, 10/22
    - in class
  - Final
    - Monday, 12/7
    - 3:30-6:30
- Communication
  - Use newsgroup, email, phone, office hours
  - But definitely prefer the newsgroup!

Prof. Aiken CS 143 Lecture 1

2

## Staff

- Instructor
  - Alex Aiken
- TAs
  - I sil Dillig
  - Tom Dillig
- Office hours, contact info on 143 web site

Prof. Aiken CS 143 Lecture 1

3

## Text

- The Purple Dragon Book
- Aho, Lam, Sethi & Ullman
- Not required
  - But a useful reference

Prof. Aiken CS 143 Lecture 1

4

## Course Structure

- Course has theoretical and practical aspects
- Need both in programming languages!
- Written assignments = theory
  - Class hand-in
- Programming assignments = practice
  - Electronic hand-in

Prof. Aiken CS 143 Lecture 1

5

## Academic Honesty

- Don't use work from uncited sources
  - Including old code
- We use plagiarism detection software
  - many cases in past offerings

Prof. Aiken CS 143 Lecture 1

6

## The Course Project

---

- A big project
- ... in 4 easy parts
- Start early!

## How are Languages Implemented?

---

- Two major strategies:
  - Interpreters (older)
  - Compilers (newer)
- Interpreters run programs “as is”
  - Little or no preprocessing
- Compilers do extensive preprocessing

## Language Implementations

---

- Batch compilation systems dominate
  - gcc
- Some languages are primarily interpreted
  - Java bytecode
- Some environments (Lisp) provide both
  - Interpreter for development
  - Compiler for production

## History of High-Level Languages

---

- 1954 IBM develops the 704
  - Successor to the 701
- Problem
  - Software costs exceeded hardware costs!
- All programming done in assembly

## The Solution

---

- Enter “Speedcoding”
- An interpreter
- Ran 10-20 times slower than hand-written assembly

## FORTRAN I

---

- Enter John Backus
- Idea
  - Translate high-level code to assembly
  - Many thought this impossible
  - Had already failed in other projects

## FORTRAN I (Cont.)

- 1954-7
  - FORTRAN I project
- 1958
  - >50% of all software is in FORTRAN
- Development time halved

Line	Statement	Column
1	PROGRAM FOR FINDING THE LARGEST VALUE	
2	DATA ONE, TWO, THREE, FOUR, FIVE	
3	DO I=1,5	
4	READ (5,10) X	
5	IF (X) GO TO 10	
6	GO TO 20	
7	10 X=LARGE	
8	20 CONTINUE	
9	WRITE (6,20) X	
10	END	

Prof. Aiken CS 143 Lecture 1

13

## FORTRAN I

- The first compiler
  - Huge impact on computer science
- Led to an enormous body of theoretical work
- Modern compilers preserve the outlines of FORTRAN I

Prof. Aiken CS 143 Lecture 1

14

## The Structure of a Compiler

1. Lexical Analysis
2. Parsing
3. Semantic Analysis
4. Optimization
5. Code Generation

The first 3, at least, can be understood by analogy to how humans comprehend English.

Prof. Aiken CS 143 Lecture 1

15

## Lexical Analysis

- First step: recognize words.
  - Smallest unit above letters

This is a sentence.

Prof. Aiken CS 143 Lecture 1

16

## More Lexical Analysis

- Lexical analysis is not trivial. Consider:
 

ist his ase nte nce

Prof. Aiken CS 143 Lecture 1

17

## And More Lexical Analysis

- Lexical analyzer divides program text into "words" or "tokens"
 

If x == y then z = 1; else z = 2;
- Units:

Prof. Aiken CS 143 Lecture 1

18

## Parsing

- Once words are understood, the next step is to understand sentence structure
- Parsing = Diagramming Sentences
  - The diagram is a tree

Prof. Aiken CS 143 Lecture 1

19

## Diagramming a Sentence

Prof. Aiken CS 143 Lecture 1

20

## Parsing Programs

- Parsing program expressions is the same
- Consider:

`If x == y then z = 1; else z = 2;`

- Diagrammed:

Prof. Aiken CS 143 Lecture 1

21

## Semantic Analysis

- Once sentence structure is understood, we can try to understand "meaning"
  - But meaning is too hard for compilers
- Compilers perform limited analysis to catch inconsistencies

Prof. Aiken CS 143 Lecture 1

22

## Semantic Analysis in English

- Example:  
`Jack said Jerry left his assignment at home.`  
What does "his" refer to? Jack or Jerry?
- Even worse:  
`Jack said Jack left his assignment at home?`  
How many Jacks are there?  
Which one left the assignment?

Prof. Aiken CS 143 Lecture 1

23

## Semantic Analysis in Programming

- Programming languages define strict rules to avoid such ambiguities
- This C++ code prints "4"; the inner definition is used

```
{  
  int Jack = 3;  
  {  
    int Jack = 4;  
    cout << Jack;  
  }  
}
```

Prof. Aiken CS 143 Lecture 1

24

## More Semantic Analysis

- Compilers perform many semantic checks besides variable bindings
- Example:  
*Jack left her homework at home.*
- A “type mismatch” between *her* and *Jack*; we know they are different people
  - Presumably Jack is male

Prof. Aiken CS 143 Lecture 1

25

## Optimization

- No strong counterpart in English, but akin to editing
- Automatically modify programs so that they
  - Run faster
  - Use less memory
  - In general, conserve some resource
- The project has no optimization component

Prof. Aiken CS 143 Lecture 1

26

## Optimization Example

*X = Y \* 0* is the same as *X = 0*

Prof. Aiken CS 143 Lecture 1

27

## Code Generation

- Produces assembly code (usually)
- A translation into another language
  - Analogous to human translation

Prof. Aiken CS 143 Lecture 1

28

## Intermediate Languages

- Many compilers perform translations between successive intermediate forms
  - All but first and last are *intermediate languages* internal to the compiler
  - Typically there is 1 IL
- IL's generally ordered in descending level of abstraction
  - Highest is source
  - Lowest is assembly

Prof. Aiken CS 143 Lecture 1

29

## Intermediate Languages (Cont.)

- IL's are useful because lower levels expose features hidden by higher levels
  - registers
  - memory layout
  - etc.
- But lower levels obscure high-level meaning

Prof. Aiken CS 143 Lecture 1

30

## Issues

---

- Compiling is almost this simple, but there are many pitfalls.
- Example: How are erroneous programs handled?
- Language design has big impact on compiler
  - Determines what is easy and hard to compile
  - Course theme: many trade-offs in language design

Prof. Aiken CS 143 Lecture 1

31

## Compilers Today

---

- The overall structure of almost every compiler adheres to our outline
- The proportions have changed since FORTRAN
  - Early: lexing, parsing most complex, expensive
  - Today: optimization dominates all other phases, lexing and parsing are cheap

Prof. Aiken CS 143 Lecture 1
