

# Java

## Lecture 18

Prof. Aiken CS 143 Lecture 18

1

## Lecture Outline

---

- Java: COOL on steroids
  - History
- Arrays
- Exceptions
- Interfaces
- Coercions
- Threads
- Dynamic Loading & Initialization
- Summary

Prof. Aiken CS 143 Lecture 18

2

## Java History

---

- Began as Oak at SUN
  - Originally targeted at set-top devices
  - Initial development took several years ('91-'94)
- Retargeted as the Internet language ('94-'95)
  - Every new language needs a "killer app"
  - Beat out TCL, Python
  - ActiveX came later

Prof. Aiken CS 143 Lecture 18

3

## The People

---

- James Gosling
  - Principal designer
  - CMU Ph.D.
- Bill Joy
  - ABD from Berkeley (Unix)
- Guy Steele
  - MIT PhD
  - Famous languages researcher

Prof. Aiken CS 143 Lecture 18

4

## Influences

---

- Modula-3
  - types
- Eiffel, Objective C, C++
  - Object orientation, interfaces
- Lisp
  - Java's dynamic flavor (lots of features)

Prof. Aiken CS 143 Lecture 18

5

## Java Design

---

- From our perspective, COOL plus
  - Exceptions
  - Interfaces
  - Threads
  - Dynamic Loading
  - Other less important ones . . .
- Java is a BIG language
  - Lots of features
  - Lots of feature interactions

Prof. Aiken CS 143 Lecture 18

6

## Arrays

Assume  $B < A$ . What happens in the following?

```
B[] b = new B[10];  
A[] a = b;  
  
a[0] = new A();  
b[0].aMethodNotDeclaredInA();
```

Prof. Aiken CS 143 Lecture 18

7

## Subtyping In Java

$B < A$	if $B$ inherits from $A$	as in Cool
$C < A$	if $C < B$ and $B < A$	as in Cool
$B[] < A[]$	if $B < A$	not as in Cool

This last rule is unsound!

Prof. Aiken CS 143 Lecture 18

8

## What's Going On?

```
B[] b = new B[10];  
A[] a = b;  
a[0] = new A();  
b[0].aMethodNotDeclaredInA();
```

*Having multiple aliases to updateable locations with different types is unsound*

Prof. Aiken CS 143 Lecture 18

9

## The Right Solution

- Disallow subtyping through arrays
- Standard solution in several languages

$B < A$	if $B$ inherits from $A$
$C < A$	if $C < B$ and $B < A$
$B[] < A[]$	if $B = A$

Prof. Aiken CS 143 Lecture 18

10

## The Java Solution

- Java fixes the problem by checking each array assignment at runtime for type correctness
  - Is the type of the object being assigned compatible with the type of the array?
- Huge overhead on array computations!
- But note: arrays of primitive types unaffected
  - Primitive types are not classes

Prof. Aiken CS 143 Lecture 18

11

## A Common Problem

- Deep in a section of code, you encounter an unexpected error
  - Out of memory
  - A list that is supposed to be sorted is not
  - etc.
- What do you do?

Prof. Aiken CS 143 Lecture 18

12

## Exceptions

- Add a new type (class) of *exceptions*
- Add new forms

```
try { something } catch(x) { cleanup }
throw exception
```

Prof. Aiken CS 143 Lecture 18

13

## Example

```
class Foo {
  public static void main(String[] args) {
    try { X(); } catch (Exception e) {
      System.out.println("Error!") } }

  public void X() throws MyException {
    throw new MyException();
  }
}
```

Prof. Aiken CS 143 Lecture 18

14

## Semantics (pseudo-Java)

$T(o)$  = an exception that has been thrown  
 $o$  = an ordinary object

$$\frac{E \vdash e_1 \rightarrow o}{E \vdash \text{try } \{ e_1 \} \text{ catch}(x) \{ e_2 \} \rightarrow o}$$

$$\frac{\begin{array}{c} E \vdash e_1 \rightarrow T(o_1) \\ E[x \leftarrow o_1] \vdash e_2 \rightarrow o_2 \end{array}}{E \vdash \text{try } \{ e_1 \} \text{ catch}(x) \{ e_2 \} \rightarrow o_2}$$

Prof. Aiken CS 143 Lecture 18

15

## Semantics (Cont.)

$$\frac{E \vdash e \rightarrow o}{E \vdash \text{throw } e \rightarrow T(o)}$$

$$\frac{E \vdash e_1 \rightarrow T(o)}{E \vdash e_1 + e_2 \rightarrow T(o)}$$

*All forms except catch propagate thrown exceptions*

Prof. Aiken CS 143 Lecture 18

16

## Simple Implementation

- When we encounter a **try**
  - Mark current location in the stack
- When we **throw** an exception
  - Unwind the stack to the first **try**
  - Execute corresponding **catch**
- More complex techniques reduce the cost of **try** and **throw**

Prof. Aiken CS 143 Lecture 18

17

## Trivia Question

*What happens to an uncaught exception thrown during object finalization?*

Prof. Aiken CS 143 Lecture 18

18

## Type Checking

- Methods must declare types of exceptions they may raise

```
public void X() throws MyException
```

  - Checked at compile time
  - Some exceptions need not be part of the method signature
    - e.g., dereferencing null
- Other mundane type rules
  - `throw` must be applied to an object of type `Exception`

Prof. Aiken CS 143 Lecture 18

19

## Interfaces

- Specify relationships between classes without inheritance

```
interface PointInterface { void move(int dx, int dy); }

class Point implements PointInterface {
    void move(int dx, int dy) { ... }
}
```

Prof. Aiken CS 143 Lecture 18

20

## Interfaces

"Java programs can use interfaces to make it unnecessary for related classes to share a common abstract superclass or to add methods to `Object`."

In other words, interfaces play the same role as multiple inheritance in C++, because classes can implement multiple interfaces

```
class X implements A, B, C { ... }
```

Prof. Aiken CS 143 Lecture 18

21

## Why is this Useful?

- A graduate student may be both an University employee and a student

```
class GraduateStudent implements Employee, Student { ... }
```

- No good way to incorporate `Employee`, `Student` methods for grad students with single inheritance

Prof. Aiken CS 143 Lecture 18

22

## Implementing Interfaces

- Methods in classes implementing interfaces need not be at fixed offsets.

```
interface PointInterface { void move(int dx, int dy); }
```

```
class Point implements PointInterface {
    void move(int dx, int dy) { ... }
}
class Point2 implements PointInterface {
    void dummy() { ... }
    void move(int dx, int dy) { ... }
}
```

Prof. Aiken CS 143 Lecture 18

23

## Implementing Interfaces (Cont.)

- Dispatches `e.f(...)` where `e` has an interface type are more complex than usual
  - Because methods don't live at fixed offsets
- One approach:
  - Each class implementing an interface has a lookup table `method names → methods`
  - Hash method names for faster lookup
    - hashes computed at compile time

Prof. Aiken CS 143 Lecture 18

24

## Coercions

- Java allows primitive types to be *coerced* in certain contexts.
- In `1 + 2.0`, the `int 1` is widened to a `float 1.0`
- A coercion is really just a primitive function the compiler inserts for you
  - Most languages have extensive coercions between base numeric types

Prof. Aiken CS 143 Lecture 18

25

## Coercions & Casts

- Java distinguishes two kinds of coercions & casts:
  - *Widening* always succeed (`int` → `float`)
  - *Narrowing* may fail if data can't be converted to desired type (`float` → `int`, downcasts)
- Narrowing casts must be explicit
- Widening casts/coercions can be implicit

Prof. Aiken CS 143 Lecture 18

26

## Trivia Question

What is the only type in Java for which there are no coercions/casts defined?

Prof. Aiken CS 143 Lecture 18

27

## Coercions in PL/I

- Let `A,B,C` be 3 character strings.

```
B = '123'  
C = '456'  
A = B + C
```

- What is `A`?

Prof. Aiken CS 143 Lecture 18

28

## Threads

- Java has concurrency built in through *threads*
- Thread objects have class `Thread`
  - `start` and `stop` methods
- Synchronization obtains a lock on the object:  
`synchronized { e }`
- In synchronized methods, `this` is locked

Prof. Aiken CS 143 Lecture 18

29

## Example (from the Java Spec)

```
class Simple {  
    int a = 1, b = 2;  
    void to() { a = 3; b = 4; }  
    void fro() { println("a= " + a + ", b=" + b); }  
}
```

Two threads call `to()` and `fro()`. What is printed?

Prof. Aiken CS 143 Lecture 18

30

### Example (Cont.)

```
class Simple {  
    int a = 1, b = 2;  
    void synchronized to() { a = 3; b = 4; }  
    void fro() {println("a= " + a + ", b=" + b); }  
}
```

Two threads call `to()` and `fro()`. What is printed?

Prof. Aiken CS 143 Lecture 18

31

### Example (Cont.)

```
class Simple {  
    int a = 1, b = 2;  
    void synchronized to() { a = 3; b = 4; }  
    void synchronized fro() {println("a= " + a + ",  
        b=" + b); }  
}
```

Two threads call `to()` and `fro()`. What is printed?

Prof. Aiken CS 143 Lecture 18

32

### Semantics

- Even without synchronization, a variable should only hold values written by some thread
  - Writes of values are atomic
  - Violated for doubles, though
- Java concurrency semantics are difficult to understand in detail, particularly as to how they might be implemented on certain machines

Prof. Aiken CS 143 Lecture 18

33

### Dynamic Loading

- Java allows classes to be loaded at run time
  - Type checking source takes place at compile time
  - Bytecode *verification* takes place at run time
- Loading policies handle by a [ClassLoader](#)
- Classes may also be unloaded
  - But poorly specified in the definition

Prof. Aiken CS 143 Lecture 18

34

### Initialization

- Initialization in Java is baroque
  - Everything in COOL plus much more
  - Greatly complicated by concurrency
- A class is initialized when a symbol in the class is first used
  - Not when the class is loaded
  - Delays initialization errors to a predictable point (when something in the class is referenced)

Prof. Aiken CS 143 Lecture 18

35

### Class Initialization Procedure (Partial)

1. Lock the class object for the class
  - Wait on the lock if another thread has locked it
2. If the same thread is already initializing this class, release lock and return
3. If class already initialized, return normally
4. Otherwise, mark initialization as in progress by this thread and unlock class

Prof. Aiken CS 143 Lecture 18

36

## Class Initialization (Cont.)

---

5. Initialize superclass, fields (in textual order)
  - But initialize static, final fields first
  - Give every field a default value before initialization
6. Any errors result in an incorrectly initialized class, mark class as erroneous
7. If no errors, lock class, label class as initialized, notify threads waiting on class object, unlock class

Prof. Aiken CS 143 Lecture 18

37

## Features and Feature Interactions

---

- In any system with  $N$  features, there are potentially  $N^2$  feature interactions.
- Big, featureful systems are hard to understand!
  - Including programming languages

Prof. Aiken CS 143 Lecture 18

38

## Summary

---

- Java is pretty well done
  - By production language standards, very well done
- Java brings many important ideas into the mainstream
  - Strong static typing
  - Garbage collection
- But Java also
  - Includes many features we don't understand
  - Has a lot of features

Prof. Aiken CS 143 Lecture 18

39
